Net 80 mL

What is KP?

Keratosis Pilaris (KP) is a common, harmless skin condition that causes dry, rough patches and tiny bumps, usually on the upper arms, thighs, cheeks, or buttocks, sometimes with redness or swelling. KP is often considered a variant of normal skin. It can't be cured or prevented. KP affects nearly 50-80% of all adolescents and approximately 30-50% of adults. In general, keratosis pilaris is cosmetically displeasing but medically harmless.

Keratosis pilaris is caused by a buildup of keratin, the protein that protects skin from infections and other harmful things. The buildup forms a plug that blocks the opening of a hair follicle. These plugs usually form in groups, which result in the rough "chicken skin" texture that characterizes KP. The individual follicular bumps are often caused by a hair that is unable to reach the surface and becomes trapped beneath the keratin debris, but not all the bumps have associated hairs underneath.

Say good bye to your bumpy skin

The appearance of skin with **Keratosis Pilaris (KP)** can be improved with the usage of moisturizing lotions and exfoliants. Topical exfoliants remove dead skin cells from the surface of your skin. These include creams that contain alpha-hydroxy acid, lactic acid, salicylic acid, or urea. The condition usually disappears naturally at old age.

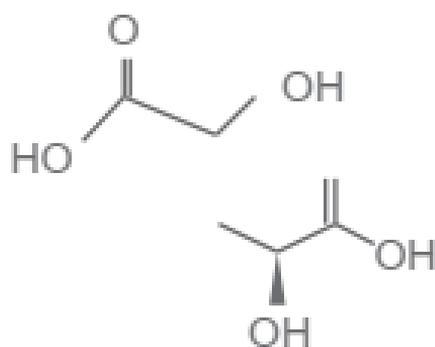

Moisturize

Locks in moisture with Natural HG and Urea while rejuvenating your skin with vitamin E, C, B3, and Provitamin-B5

Soothe

KP-CLEAR soothes your skin naturally with *Centella Asiatica* and *Moraceae Plants* extracts

Exfoliate

Powerful exfoliators will dissolve the excess Keratin that causes red bumps and rough surface. (Lactic acid, Glycolic acid, and Salicylic acid)

Did you know ?

KP affects an estimated

30-50% of the

adult population and

approximately **50-80%**

of all adolescents.
